

# Part 1. After Scenario Questionnaire (ASQ)

## Instructions

The ASQ, developed by (Lewis, 1995), is to be given to a study subject after he/she has completed a normal condition scenario. The user is to circle their answers using the provided 7 point scale (the lower the selected score, the higher the subject's usability satisfaction with their system). After the user has completed the ASQ, the ASQ score can be calculated by taking the average (arithmetic mean) of the 3 questions. If a question is skipped by the subject, the ASQ can be calculated by averaging the remaining scores.

## ASQ

# Part 2. Post Study System Usability Questionnaire (PSSUQ)

## Instructions

The PSSUQ is provided to the subject after they have completed all normal condition scenarios. Like the ASQ, the PSSUQ requires that the user circle their response to each question based on a 7-point scale (where the lower the response, the higher the subject's usability satisfaction with their system). The subject can also clarify their answers on the PSSUQ by adding comments in the provided spaces. After the subject has completed filling out the PSSUQ, it is good practice for the analyst to quickly go over the subject's answers in order to make sure the subject hasn't missed anything and that all comments are understood.

The PSSUQ can be used to produce the following measures:

- OVERALL – Overall user satisfaction with their system – calculated by taking the average of questions 1-19
- SYSUSE – System usefulness – calculated by taking the average of questions 1-8
- INFOQUAL – Information quality – calculated by taking the average of questions 9-15
- INTERQUAL – Interface quality – calculated by taking the average of questions 16-18
